FAMOCO MDM 2.5

RELEASE NOTES — February 4, 2020 — mdm.famoco.com

MDM 2.5 update is available as of Tuesday February 4, 2020 at 8pm (Paris/Brussels time). Service unavailability may occur with 30 min to 1 hour approximate duration during roll-out.

NEW

DEVICES NOTES

MDM users can now pin a small text note for each individual device. This text is available in MDM only and is not synced with the device.

- In the Devices list, an icon next to each Famoco ID signals the presence of a note.
- The device note text is available by hovering the icon. It is also displayed in the side-panel title bar (next to the Famoco ID).
- When an MDM admin moves a device to another organization, a new modal dialog allows to transfer the device notes data (or delete it).

CUSTOM ROLES

MDM admin can now create custom roles with fully tailored access rights in order to precisely manage their organization's users.

- Thin-granularity right management (read, write or delete) for each MDM main section (Fleets, Profile, Applications...).
- One-click role duplication.
- Standard roles stay available : *Admin*; *Device manager*; *Fleet manager*; *Observer*.

IMPROVEMENTS

PROFILES LIST

This list now runs with a full new implementation and comes with several updates:

- New add/edit modal dialog, now paginated in 6 sections: *Main*; *Display & Sound*; *Connectivity*; *Wi-Fi* (optional); *Mobile Data* (optional); *Applications*.
- Profiles creation in Wizard mode (a series of well-defined simple steps).
- Advanced settings with default values are hidden for more legibility and available upon a single click.
- Export new options: all rows, filtered/displayed rows or checkbox-selected rows.
- New side-panel data visualization

PERSISTENT FILTER SETTINGS

For each list (Devices, Fleets…), the filter settings are saved. Each user will see his/her filters unchanged after switching organization or login-in again,.

IMPROVED AND NEW MAPS TOOLS

- Maps gets a new full set of filters (Fleet, Profile, Sync Status, Owner, etc.)
- New device icon on maps, improved device bundle layout
- Dynamic device counter with number of devices rendered on map (some can be currently filtered or without known position) and total number of devices
- New device side-panel available by clicking on a device icon, including a new *Device Status > Location* section with its geographic coordinates (e.g. "*48.85820, 2.33870*"), a link to the map centered on the device, the localization method (GPS or IP) and the localization date.

OTHER DEVICES LIST UPGRADES

- The *put-in-stock* and *put-in-repair* modal dialogs are now displaying more precise warning information.
- Devices *Owner's name* value can now be filtered, sorted and exported.
- A *select-from-file* action cancels any ongoing filter.
- Shift + click range selection is now available.
- Side-panel keyboard navigation with arrow keys (or J/K).

CLICKABLE LOCKER ICON

On all lists, a locker icon indicates if an item cannot be deleted (e.g., an app is used by a profile that locks its deletion). Those icons are now clickable to the corresponding blocking items list.
