FAMOCO MDM 2.6

RELEASE NOTES — March 23, 2020 — mdm.famoco.com

MDM 2.6 update is available as of Monday March 23, 2020 and is delivered within the Famoco Layer v 2.27.0.

NEW

APPLICATION FILE DELIVERY OPTIMIZATIONS

The devices now download their applications through an optimized and more robust mechanism using less restricted, bigger and stronger servers. Clients using private APN wishing to finetune their set up can get in touch with the Famoco support team.

The devices can now resume applications file downloads (APK) after an interruption.

Frequently used applications are also temporarily persisted on the devices and can be reinstalled without another download.

IMPROVED SSL SESSIONS FOR DEVICE SYNCHRONIZATION

We optimized the secure communication channel between the devices and our infrastructure, reducing overall traffic by over ~50% (for passive sync, basically everything except downloads themselves).

NETWORK TIME PROTOCOL OVER FMS

In case of a date issue, the device will now query an additional Network Time Protocol (NTP) server. In case of another failure, the device will receive a time fix directly from the FMS.

IMPROVEMENTS

DASHBOARD CONNECTIVITY CHECK

Dashboard now checks connectivity with the current FMS instead of always my.famoco.com.
