

FAMOCO MDM 2.7

RELEASE NOTES — April 1, 2020 — mdm.famoco.com

MDM 2.7 update is available as of Wednesday April 1, 2020 at 8:30pm (Paris/Brussels time). Service unavailability may occur with 30 min to 1 hour approximate duration during roll-out.

This document has been edited April 2, 2020 to add a Device location real date bullet point, forgotten in the previous version.

IMPROVEMENTS

DEVICES LOCATION GPS PERSISTENCY WITH DATE AND ACCURACY

Last GPS position sent by the device now becomes persistent. If the device doesn't send any GPS position during a sync, the last one is kept and continues to be rendered on the map until a new one is received. Failing any GPS position, the device position is estimated based on its IP address and rendered on the map.

For all locations, GPS or IP estimate, the side panel displays:

- Latitude and longitude coordinates
- Device location method: *GPS* or *IP estimate*
- Device location accuracy in meters or kilometers
- Device location real date (can differ from sync date)

PROPER API ERROR MESSAGES

In case of a validation error during an API request, the HTML result page is now replaced by a proper JSON response including an error key.
